

IntelliStay HMS - Sample Knowledge Document

A small test document for learning PDF extraction, vector embeddings, semantic search, and Retrieval-Augmented Generation (RAG).

1. Reservation Management

A hotel reservation stores the guest, property, room type, arrival date, departure date, number of guests, booking source, rate plan, and reservation status. A reservation can be Confirmed, Checked In, Checked Out, or Cancelled. When a reservation is cancelled, the reserved room inventory should be released so that it can be sold again.

2. Guest Check-In

Before check-in, the hotel should verify the guest identity and confirm that the reservation is valid. The room must be available and ready for occupancy. At check-in, the reservation status changes to Checked In. The system may also record identity details and advance payment.

3. Payments

Payments may be collected during reservation, check-in, during the stay, or at checkout. Payment methods can include cash, credit card, debit card, bank transfer, or online payment. Every successful payment should be linked to the correct reservation or folio.

4. Folio and Charges

A folio contains financial transactions related to a guest stay. Room charges, restaurant charges, laundry charges, taxes, discounts, payments, and refunds can appear in the folio. The outstanding balance is calculated from charges minus payments and applicable adjustments.

5. Housekeeping

Housekeeping tracks room cleaning condition. Typical room conditions include Clean, Dirty, Inspected, and Out of Service. After a guest checks out, the room normally becomes Dirty until housekeeping completes cleaning.

6. Inventory

Room inventory represents how many rooms are available for sale for a particular date and room type. Confirmed reservations reduce available inventory. Cancellations can return inventory to availability. Overbooking should only occur when intentionally configured.

7. Direct Bill / Accounts Receivable

A corporate guest or company may be allowed to pay later using a Direct Bill or Accounts Receivable account. The account can have a credit limit and payment terms. Before posting an amount to AR, the system should confirm that the account is active and that the transaction follows the credit rules.

RAG Practice Questions

#	Question
1	What happens to room inventory when a reservation is cancelled?
2	What should the hotel verify before guest check-in?
3	When can a hotel collect payment?
4	What information can appear in a guest folio?
5	What normally happens to a room after checkout?
6	How do confirmed reservations affect inventory?
7	What should be checked before posting an amount to Accounts Receivable?

Suggested experiment: extract this PDF, split the text into chunks, create embeddings, store them in a vector database, and ask the seven questions above. Inspect which chunk is retrieved for each question before sending it to the LLM.
